

Implementing an Odoo ERP Workflow for a BLDC Motor Manufacturer

The client, a manufacturer of BLDC motors, understood the importance of building a connected system before scaling further. However, procurement, quality, and production were running as disconnected manual processes, with no single system tracking material from order to finished motor. The client's challenges included -

Business Challenges

- No connected system across purchase, quality, and production
- No way to verify delivered quantity against what was actually ordered
- No formal QC checkpoint before material reached the warehouse
- No defined process for handling rejected material
- No bill of materials to guide production requirements
- No automatic link between inventory and production usage
- Manual, error-prone stock tracking
- No single source of truth across the shop floor

Timeline:
1
MONTH

What We Delivered

- End-to-end Odoo ERP implementation: Purchase, Quality Control, and Production modules
- Purchase requisition to auto-generated purchase orders
- Receipt and GRN tracking to verify ordered vs. delivered quantity
- QC module with pass/fail inspection for incoming material
- Automatic routing to warehouse on pass, disposition on fail
- BOM setup for two BLDC motor variants: 1200W and 1500W
- Inventory-to-production issuance with automatic stock deduction

Our Approach

Purchase Requisition & Purchase Order — Configured the purchase module starting with the purchase requisition as the first transaction, so approved requisitions auto-create the purchase order.

Receipt & GRN — Set up the receipt as proof of what was ordered and delivered, followed by a Goods Receipt Note (GRN) confirming the actual quantity arrived against the ordered quantity.

Quality Control Workflow — Configured the QC module so incoming material is inspected and marked pass or fail by the QC team before it proceeds further.

Warehouse Routing — Material that passes QC is routed automatically to the main warehouse; material that fails QC is routed to a disposition process based on the type of material.

Bill of Materials & Production — Built the production module around bills of materials for the two BLDC motor variants — 1200W and 1500W — to structure how each motor is manufactured.

Inventory-to-Production Handoff — Once a BOM is approved and production begins, inventory issues the requested material to production and the on-hand stock is deducted automatically — closing the loop from purchase through to the finished BLDC motor.

Key Outcome:

Unified purchase-to-production traceability across the BLDC motor line

Formal QC pass/fail checkpoint before material reaches the warehouse

Real-time inventory visibility as material moves from procurement to production

74% report a lack of operational visibility before switching to ERP — the exact gap this implementation was built to close
